

Intelligent power switch

Features

- Low side or high side switch configuration
- 6 V to 48 V supply voltage range
- Overload and short circuit protections
- Internal voltage clamping
- Supply and output reversal protection
- Thermal shutdown
- GND and V_S open wire protection
- Adjustable delay at switch on
- Indicator status led driver
- +5 V regulated aux. voltage
- High burst immunity

Description

The TDE1708DFT is an integrated power switch with up to 48 V power supply capability. Two output configurations are possible:

Load to GND (high side mode)

Load to V_S (low side mode)

Especially dedicated to proximity detectors, its internal +5 V supply can be used to supply external circuits (See also AN495).

A signal is internally generated to block the In signal, and prevent activation of the output switch, as long as an abnormal condition is detected. The power-on transition, as well as the chip over temperature and the output overcurrent, concur to the generation of such signal. A minimum delay of 25 ms (Typ. value) is added to the trailing edge of such signal to ensure that a stable normal situation is present when the signal disappears. The delay (of the disappearance of the block signal; no delay at its on set) can be further increased connecting a capacitor between pin3 and ground. It can drive resistive or inductive loads.

2 Electrical specifications

2.1 Thermal data

Table 3. Thermal data

Symbol	Description	Value	Unit
R_{thJA}	Thermal resistance junction-ambient. (max)	32 ⁽¹⁾	°C/W
R_{thJC}	Thermal resistance junction-case. (max)	1.2	°C/W

1. Soldered to a 4 layer board with 4 vias in the pad.

2.2 Absolute maximum ratings

Table 4. Absolute maximum ratings

Symbol	Parameter	Value	Unit
V_S	Supply voltage	50	V
V_S	Supply reverse voltage	50	V
I_o	Output current	internally limited	A
V_{reg}	Regulated voltage pin	0 to 7	V
V_{delay}	Delay cap. source pin	0 to 5	V
V_o	Output dif. voltage	55	V
V_i	Input voltage	-10 to 50	V
T_J	Junction operating temperature	Internally limited	°C
T_{stg}	Storage temperature range	-55 to 150	°C
P_{tot}	Power dissipation	internally limited	mW
E_i	Energy inductive load	100	mJ

2.3 Electrical characteristics

**Table 5. Electrical characteristics
($V_S = 24 \text{ V}$; $T_J = -25 \text{ to } +85 \text{ }^\circ\text{C}$ unless otherwise specified)**

Symbol	Parameter	Test conditions	Min	Typ	Max	Unit
V_S	Supply voltage		6		48	V
I_{sr}	Supply reverse current	$V_{SR} = -48 \text{ V}$			1.5	mA
I_q	Quiescent current	$I_{reg} = I_{led} = 0; V_i < 2 \text{ V}; V_S = 6 \text{ to } 48 \text{ V}$			1.5	mA
I_o	Output current	$V_S = 6 \text{ to } 48 \text{ V}$			250	mA
V_{sat}	Output voltage drop	$I_o = 200 \text{ mA}$		1	1.5	V
I_{SCLS}	Short circuit current in low side configuration		0.3	0.4	0.6	A
I_{SCHS}	Short circuit current in high side configuration		0.25	0.3	0.40	A
V_{cl}	Internal voltage clamp	$I_{CL} = 10 \text{ mA}$	55		70	V
I_{olk}	Output leakage	(Pin 2) $V_i < 2 \text{ V}; V_o = 0 \text{ to } V_S$ (Pin 8)		100	300 100	μA μA
V_{ith}	Input voltage threshold		2		3	V
V_{ihis}	Input threshold hysteresis			300		mV
I_{lk}	Input current	$V_i = 5 \text{ V}$		2	5	μA
V_{reg}	Regulated output voltage	$I_{reg} < 5 \text{ mA}$	4.5	5	5.5	V
I_{scr}	Short circuit regulated		6	30	50	mA
I_{reg}	Output regulator current	$V_S = 35 \text{ V}$ $V_S = 48 \text{ V}$			6 4	mA mA
I_{old}	Current source sink led driver	Output ON (\pm)	2	3	4	mA
V_{old}	Voltage drop led driver	$I_{os} = 2 \text{ mA } (\pm)$		1.2	1.6	V
$Oldlk$	LED driver (off) Leak.	$V_i < 2 \text{ V}; R_L < 1 \text{ k}\Omega$			10	μA
I_{dch}	Del. cap. charge current	$T_J = 25 \text{ }^\circ\text{C}$	2	4	6	μA
V_{dth}	Delay voltage trigger			4		V
T_{TSD}	Thermal shutdown temperature			180		${}^\circ\text{C}$

2.4 Dynamic information

Table 6. Dynamic information ($V_S = 24$ V; $T_J = 25$ °C; $R_L = 48$ Ω)

Symbol	Parameter	Test conditions	Min	Typ	Max	Unit
t_{on}	Propagation turn on time	$V_i = 0$ to 5V		15		μs
t_{off}	Propagation turn off time			15		μs
t_{don}	Delayed turn on time / nF delay capacitor		0.65	1	2	ms
$t_{d\ min}$	Minimum delayed t_{on} Delay capacitor = 0			25		μs

3 Application information

The LED driver tells the output status. It can source or sink current ($I_{old\ typ} = 3\ mA$), according to the output configuration chosen. The thresholds, represented by the output comparator in the block diagram, are set at about 1.5 V - 2 V.

For instance, in the high side load case of the Application Circuit, when the voltage on pin 8 (the output) differs from V_{CC} less than 1.5 V, the output is sensed in "OFF" state and the LED driver is disabled.

If instead pin 8 differs from V_{CC} more than 3 V (the output comparator threshold value plus the drop voltage on the LED), then the output is sensed "ON" and the driver will force the current on the LED.

Figure 3. Low side driver topology

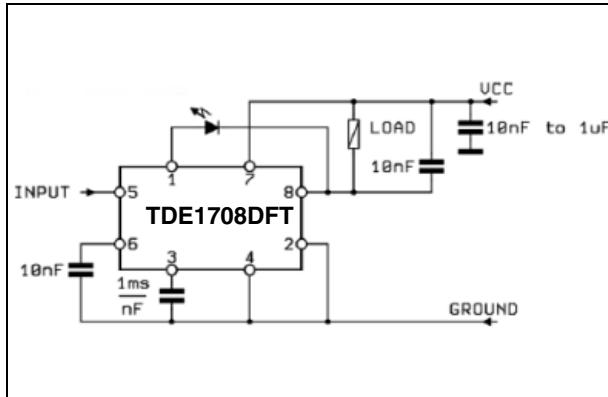

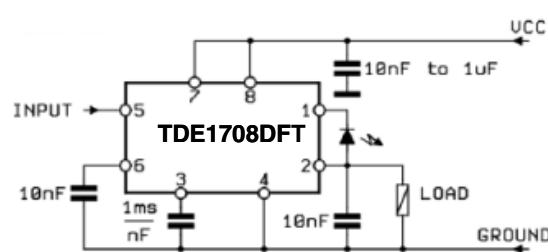

Figure 4. High side driver topology

3.1 Adjustable input hysteresis circuit

The TDE1708DFT is a device realized in bipolar technology and therefore it has the usual problems of temperature compensation that such technology involves; despite all it maintains an input dynamics within 1 V over industrial temperatures range.

In all input voltage range it will guarantee a high impedance of $1 \text{ M}\Omega$ determining an input current about $2 \mu\text{A}$.

Exploiting this input high impedance is possible connects a sensor directly on it and bypass the obstacle of active signal conditioning circuit using a voltage firm point as ground of sensor, the delay capacitor, connected on the pin 3, as low pass filter and capacitor on Vreg pin to minimize the noise on it and protect for errors the low-voltage internal circuits, according AN495.

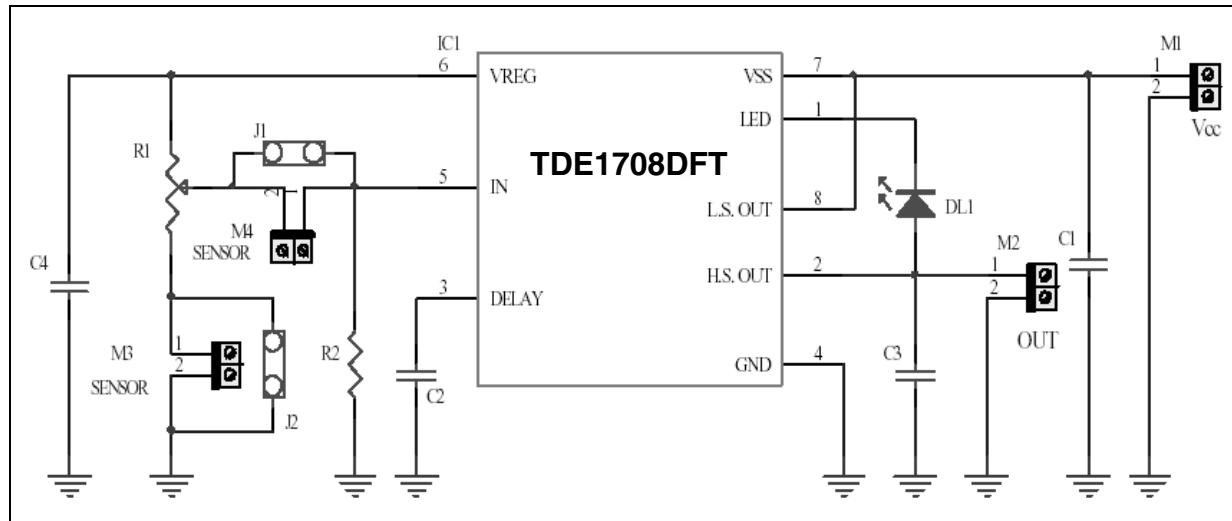

In *Figure 5*, the input external network is optimized for accepting both a sensor with ground connected to the body and a sensor with independent ground.

In order to ground the body of the sensor, J1 has to be shorted, while J2 opened and connect the sensor on M3; in case of independent ground J1 must be opened, J2 shorted and the sensor connected on M4.

DL1 indicate commutation status of the device output and C3 realize a simple output filtering in case is used an inductive load. With C2 about 10 nF we obtain a good filtering and immunity from input voltage noise. C4 is $4,7\text{nF}$ according AN495.

R2 is an optional resistor plugged only when the sensor needs to adapt its impedance with the input impedance of device.
